# Automata on Finite Words

#### **Definition**

A nondeterministic finite automaton (NFA) over  $\Sigma$  is a 4-tuple  $A = \langle S, I, T, F \rangle$ , where:

- S is a finite set of states,
- $I \subseteq S$  is a set of *initial states*,
- $T \subseteq S \times \Sigma \times S$  is a transition relation,
- $F \subseteq S$  is a set of *final states*.

We denote  $T(s, \alpha) = \{s' \in S \mid (s, \alpha, s') \in T\}$ . When T is clear from the context we denote  $(s, \alpha, s') \in T$  by  $s \xrightarrow{\alpha} s'$ .

### Runs and Acceptance Conditions

Given a finite word  $w \in \Sigma^*$ ,  $w = \alpha_1 \alpha_2 \dots \alpha_n$ , a *run* of A over w is a finite sequence of states  $s_1, s_2, \dots, s_n, s_{n+1}$  such that  $s_1 \in I$  and  $s_i \xrightarrow{\alpha_i} s_{i+1}$  for all  $1 \le i \le n$ .

A run over w between  $s_i$  and  $s_j$  is denoted as  $s_i \xrightarrow{w} s_j$ .

The run is said to be *accepting* if and only if  $s_{n+1} \in F$ . If A has an accepting run over w, then we say that A accepts w.

The language of A, denoted  $\mathcal{L}(A)$  is the set of all words accepted by A.

A set of words  $S \subseteq \Sigma^*$  is *recognizable* if there exists an automaton A such that  $S = \mathcal{L}(A)$ .

## **Determinism and Completeness**

**Definition 1** An automaton  $A = \langle S, I, T, F \rangle$  is deterministic (DFA) if and only if  $||I|| \le 1$  and, for each  $s \in S$  and for each  $\alpha \in \Sigma$ ,  $||T(s, \alpha)|| \le 1$ .

If A is deterministic we write  $T(s, \alpha) = s'$  instead of  $T(s, \alpha) = \{s'\}$ .

**Definition 2** An automaton  $A = \langle S, I, T, F \rangle$  is complete if and only if  $||I|| \ge 1$  and, for each  $s \in S$  and for each  $\alpha \in \Sigma$ ,  $||T(s, \alpha)|| \ge 1$ .

### **Determinism and Completeness**

**Proposition 1** If A is deterministic, then it has at most one run for each input word.

**Proposition 2** If A is complete, then it has at least one run for each input word.

#### **Determinization**

**Theorem 1** For every NFA A there exists a DFA  $A_d$  such that  $\mathcal{L}(A) = \mathcal{L}(A_d)$ .

Let 
$$A_d = \langle 2^S, \{I\}, T_d, \{G \subseteq S \mid G \cap F \neq \emptyset\} \rangle$$
, where 
$$(S_1, \alpha, S_2) \in T_d \iff S_2 = \{s' \mid \exists s \in S_1 : (s, \alpha, s') \in T\}$$

This definition is known as subset construction.

**Exercise 1** Let  $\Sigma = \{a,b\}$  and  $L_n = \{uav \mid u,v \in \Sigma^*, |v| = n-1\}$ , for each integer  $n \geq 1$ . Build an NFA that recognizes  $L_n$  and apply subset construction to it.

# Completion

**Lemma 1** For every NFA A there exists a complete NFA  $A_c$  such that  $\mathcal{L}(A) = \mathcal{L}(A_c)$ .

Let  $A_c = \langle S \cup \{\sigma\}, I, T_c, F \rangle$ , where  $\sigma \notin S$  is a new sink state. The transition relation  $T_c$  is defined as:

$$\forall s \in S \forall \alpha \in \Sigma \ . \ (s, \alpha, \sigma) \in T_c \iff \forall s' \in S \ . \ (s, \alpha, s') \not\in T$$

and  $\forall \alpha \in \Sigma : (\sigma, \alpha, \sigma) \in T_c$ .

**Remark**: The subset construction yields a complete deterministic automaton, with sink state  $\emptyset$ .

### Closure Properties

**Theorem 2** Let  $A_1 = \langle S_1, I_1, T_1, F_1 \rangle$  and  $A_2 = \langle S_2, I_2, T_2, F_2 \rangle$  be two NFA, such that  $S_1 \cap S_2 = \emptyset$ . There exists automata  $\bar{A}_1$ ,  $A_{\cup}$  and  $A_{\cap}$  that recognize the languages  $\Sigma^* \setminus \mathcal{L}(A_1)$ ,  $\mathcal{L}(A_1) \cup \mathcal{L}(A_2)$ , and  $\mathcal{L}(A_1) \cap \mathcal{L}(A_2)$ , respectively.

Let  $A' = \langle S', I', T', F' \rangle$  be the complete and deterministic (why?) automaton such that  $\mathcal{L}(A_1) = \mathcal{L}(A')$ , and  $\bar{A}_1 = \langle S', I', T', S' \setminus F' \rangle$ .

Let  $A_{\cup} = \langle S_1 \cup S_2, I_1 \cup I_2, T_1 \cup T_2, F_1 \cup F_2 \rangle$ .

Let  $A_{\cap} = \langle S_1 \times S_2, I_1 \times I_2, T_{\cap}, F_1 \times F_2 \rangle$  where:

 $(\langle s_1, t_1 \rangle, \alpha, \langle s_2, t_2 \rangle) \in T_{\cap} \iff (s_1, \alpha, s_2) \in T_1 \text{ and } (t_1, \alpha, t_2) \in T_2$ 

### On the Exponential Blowup of Complementation

**Theorem 3** For every  $n \in \mathbb{N}$ ,  $n \geq 1$ , there exists an automaton A, with size(A) = n + 1 such that no deterministic automaton with less than  $2^n$  states recognizes the complement of  $\mathcal{L}(A)$ .

Let  $\Sigma = \{a, b\}$  and  $L_n = \{uav \mid u, v \in \Sigma^*, |v| = n - 1\}$ , for all  $n \ge 1$ .

There exists a NFA with exactly n+1 states which recognizes  $L_n$ .

Suppose that  $B = \langle S, \{s_0\}, T, F \rangle$ , is a (complete) DFA with  $||S|| < 2^n$  that accepts  $\Sigma^* \setminus L_n$ .

### On the Exponential Blowup of Complementation

 $\|\{w \in \Sigma^* \mid |w| = n\}\| = 2^n \text{ and } \|S\| < 2^n \text{ (by the pigeonhole principle)}$ 

$$\Rightarrow \exists uav_1, ubv_2 : |uav_1| = |ubv_2| = n \text{ and } s \in S : s_0 \xrightarrow{uav_1} s \text{ and } s_0 \xrightarrow{ubv_2} s$$

Let  $s_1$  be the (unique) state of B such that  $s \xrightarrow{u} s_1$ .

Since  $|uav_1| = n$ , then  $uav_1u \in L_n \Rightarrow uav_1u \notin \mathcal{L}(B)$ , i.e. s is not accepting.

On the other hand,  $ubv_2u \notin L_n \Rightarrow ubv_2u \in \mathcal{L}(B)$ , i.e. s is accepting, contradiction.

# **Projections**

Let the input alphabet be  $\Sigma = \Sigma_1 \times \Sigma_2$ . Any word  $w \in \Sigma^*$  can be uniquely identified to a pair  $\langle w_1, w_2 \rangle \in \Sigma_1^* \times \Sigma_2^*$  such that  $|w_1| = |w_2| = |w|$ .

The *projection* operations are

$$pr_1(L) = \{v \in \Sigma_2^* \mid \langle u, v \rangle \in L, \text{ for some } u \in \Sigma_1^* \} \text{ and } pr_2(L) = \{u \in \Sigma_1^* \mid \langle u, v \rangle \in L, \text{ for some } v \in \Sigma_2^* \}.$$

**Theorem 4** If the language  $L \subseteq (\Sigma_1 \times \Sigma_2)^*$  is recognizable, then so are the projections  $pr_i(L)$ , for i = 1, 2.

#### Remark

The operations of union, intersection and complement correspond to the boolean  $\vee$ ,  $\wedge$  and  $\neg$ .

The projection corresponds to the first-order existential quantifier  $\exists x$ .

## The Myhill-Nerode Theorem

Let  $A = \langle S, I, T, F \rangle$  be an automaton over the alphabet  $\Sigma^*$ .

Define the relation  $\sim_A \subseteq \Sigma^* \times \Sigma^*$  as:

$$u \sim_A v \iff [\forall s, s' \in S : s \xrightarrow{u} s' \iff s \xrightarrow{v} s']$$

 $\sim_A$  is an equivalence relation of finite index

Let  $L \subseteq \Sigma^*$  be a language. Define the relation  $\sim_L \subseteq \Sigma^* \times \Sigma^*$  as:

$$u \sim_L v \iff [\forall w \in \Sigma^* : uw \in L \iff vw \in L]$$

 $\sim_L$  is an equivalence relation

# The Myhill-Nerode Theorem

**Theorem 5** A language  $L \subseteq \Sigma^*$  is recognizable iff  $\sim_L$  is of finite index.

" $\Rightarrow$ " Suppose  $L = \mathcal{L}(A)$  for some automaton A.

 $\sim_A$  is of finite index.

for all  $u, v \in \Sigma^*$  we have  $u \sim_A v \Rightarrow u \sim_L v$ 

index of  $\sim_L \leq$  index of  $\sim_A < \infty$ 

## The Myhill-Nerode Theorem

"\( ='' \sigma\_L \) is an equivalence relation of finite index, and let [u] denote the equivalence class of  $u \in \Sigma^*$ .

 $A = \langle S, I, T, F \rangle$ , where:

- $\bullet \ S = \{ [u] \mid u \in \Sigma^* \},\$
- $I = [\epsilon]$ ,
- $[u] \xrightarrow{\alpha} [v] \iff u\alpha \sim_L v$ ,
- $F = \{ [u] \mid u \in L \}.$

For DFA all minimal automata are isomorphic.

For NFA there may be more non-isomorphic minimal automata.

### Pumping Lemma

**Lemma 2 (Pumping)** Let  $A = \langle S, I, T, F \rangle$  be a finite automaton with size(A) = n, and  $w \in \mathcal{L}(A)$  be a word of length  $|w| \geq n$ . Then there exists three words  $u, v, t \in \Sigma^*$  such that:

- 1.  $|v| \ge 1$ ,
- 2. w = uvt and,
- 3. for all  $k \geq 0$ ,  $uv^k t \in \mathcal{L}(A)$ .

# Example

 $L = \{a^n b^n \mid n \in \mathbb{N}\}$  is not recognizable:

Suppose that there exists an automaton A with size(A) = N, such that  $L = \mathcal{L}(A)$ .

Consider the word  $a^n b^n \in L = \mathcal{L}(A)$ , such that  $n \geq N$ .

There exists words u, v, w such that  $|v| \ge 1$ ,  $uvw = a^nb^n$  and  $uv^kw \in L$  for all  $k \ge 1$ . Then  $a^{n+k|v|}b^n \in L$ , for all  $k \ge 1$ , contradiction.

# **Decidability**

Given nondeterministic finite automata A and B:

- Emptiness  $\mathcal{L}(A) = \emptyset$  ?
- Inclusion  $\mathcal{L}(A) \subseteq \mathcal{L}(B)$  ?
- Equivalence  $\mathcal{L}(A) = \mathcal{L}(B)$  ?
- Infinity  $\|\mathcal{L}(A)\| < \infty$ ?
- Universality  $\mathcal{L}(A) = \Sigma^*$ ?

# **Emptiness**

**Theorem 6** Let A be an automaton with size(A) = n. If  $\mathcal{L}(A) \neq \emptyset$ , then there exists a word of length less than n that is accepted by A.

Let u be the shortest word in  $\mathcal{L}(A)$ .

If |u| < n we are done.

If  $|u| \ge n$ , there exists  $u_1, v, u_2 \in \Sigma^*$  such that |v| > 1 and  $u_1vu_2 = u$ .

Then  $u_1u_2 \in \mathcal{L}(A)$  and  $|u_1u_2| < |u_1vu_2|$ , contradiction.

### Everything is decidable

**Theorem 7** The emptiness, equality, infinity and universality problems are decidable for automata on finite words.

Although complexity varies from problem to problem:

- Emptiness  $(\mathcal{L}(A) = \emptyset)$  belongs to NLOGSPACE
- Inclusion  $(\mathcal{L}(A) \subseteq \mathcal{L}(B))$  is PSPACE-complete
- Equivalence  $(\mathcal{L}(A) = \mathcal{L}(B))$  is PSPACE-complete
- Infinity  $(\|\mathcal{L}(A)\| < \infty)$  belongs to NLOGSPACE
- Universality  $(\mathcal{L}(A) = \Sigma^*)$  is PSPACE-complete

# Automata on Finite Words and WS1S

#### $\overline{\text{WS1S}}$

Let  $\Sigma = \{a, b, \ldots\}$  be a finite alphabet.

Any finite word  $w \in \Sigma^*$  induces the *finite* sets  $p_a = \{p \mid w(p) = a\}$ .

- $x \le y : x$  is less than y,
- s(x) = y : y is the successor of x,
- $p_a(x)$ : a occurs at position x in w

Remember that  $\leq$  and s(.) can be defined one from another.

#### **Problem Statement**

Given a sentence  $\varphi$  in WS1S, let  $\mathcal{L}(\varphi) = \{w \mid \mathfrak{m}_w \models \varphi\}$ , where  $\mathfrak{m}_w = \langle dom(w), \{\bar{p}_a\}_{a \in \Sigma}, \leq \rangle$ , such that:

- $dom(w) = \{0, 1, \dots, n-1\},\$
- $\bullet \ \bar{p_a} = \{x \in dom(w) \mid w(x) = a\},\$

A language  $L \subseteq \Sigma^*$  is said to be WS1S-definable iff there exists a WS1S sentence  $\varphi$  such that  $L = \mathcal{L}(\varphi)$ .

- 1. Given A build  $\varphi_A$  such that  $\mathcal{L}(A) = \mathcal{L}(\varphi)$
- 2. Given  $\varphi$  build  $A_{\varphi}$  such that  $\mathcal{L}(A) = \mathcal{L}(\varphi)$

The recognizable and WS1S-definable languages coincide

# Coding of $\Sigma$

Let  $m \in \mathbb{N}$  be the smallest number such that  $\|\Sigma\| \leq 2^m$ .

W.l.o.g. assume that  $\Sigma = \{0,1\}^m$ , and let  $X_1 \dots X_p, x_{p+1}, \dots x_m$ 

A word  $w \in \Sigma^*$  induces an *interpretation* of  $X_1 \dots X_p, x_{p+1}, \dots x_m$ :

- $i \in \iota_w(X_j)$  iff the j-th element of  $w_i$  is 1, and
- $\iota_w(x_j) = i$  iff  $w_i$  has 1 on the j-th position and, for all  $k \neq i$   $w_k$  has 0 on the j-th position.

## Example

**Example 1** Let  $\Sigma = \{a, b, c, d\}$ , encoded as a = (00), b = (01), c = (10) and d = (11). Then the word abbaacdd induces the valuation  $X_1 = \{5, 6, 7\}$ ,  $X_2 = \{1, 2, 6, 7\}$ .  $\square$ 

#### From Automata to Formulae

Let  $A = \langle S, I, T, F \rangle$  with  $S = \{s_1, ..., s_p\}$ , and  $\Sigma = \{0, 1\}^m$ .

Build  $\Phi_A(X_1,\ldots,X_m)$  such that  $\forall w\in\Sigma^*$ .  $w\in\mathcal{L}(A)\iff \llbracket\Phi_A\rrbracket_{\iota_w}^{\mathfrak{m}_w}=\mathrm{true}$ 

Let  $a \in \{0,1\}^m$ . Let  $\Phi_a(x, X_1, \dots, X_m)$  be the conjunction of:

- $X_i(x)$  if the  $a_i = 1$ , and
- $\neg X_i(x)$  otherwise.

For all  $w \in \Sigma^*$  we have  $\mathfrak{m}_w \models \forall x \ . \ \bigvee_{a \in \Sigma} \Phi_a(x, \vec{X})$ 

Notice that  $\Phi_a \wedge \Phi_b$  is unsatisfiable, for  $a \neq b$ .

# Coding of S

Let  $\{Y_1, \ldots, Y_p\}$  be set variables.

 $Y_i$  is the set of all positions labeled by A with state  $s_i$  during some run

$$\Phi_S(Y_1,\ldots,Y_p)$$
 :  $\forall z$  .  $\bigvee_{1\leq i\leq p} Y_i(z) \land \bigwedge_{1\leq i< j\leq p} \neg \exists z$  .  $Y_i(z) \land Y_j(z)$ 

## Coding of I

Every run starts from an initial state:

$$\Phi_I(Y_1,\ldots,Y_p) : \exists x \forall y : x \leq y \land \bigvee_{s_i \in I} Y_i(x)$$

# Coding of T

Consider the transition  $s_i \xrightarrow{a} s_j$ :

$$\Phi_T(X_1, \dots, X_m, Y_1, \dots, Y_p) : \forall x . \neg last(x) \land Y_i(x) \land \Phi_a(x, \vec{X}) \rightarrow \bigvee_{(s_i, a, s_j) \in T} Y_j(s(x))$$

where  $last(x) = \forall y . y \leq x$ 

## Coding of F

The last state on the run is a final state:

$$\Phi_F(Y_1,\ldots,Y_p): \exists x : last(x) \land \bigvee_{s_i \in F} Y_i(x)$$

$$\Phi_A = \exists Y_1 \dots \exists Y_p \cdot \Phi_S \wedge \Phi_I \wedge \Phi_T \wedge \Phi_F$$

#### From Formulae to Automata

Let  $\Phi(X_1,\ldots,X_p,x_{p+1},\ldots,x_m)$  be a WS1S formula.

Build an automaton  $A_{\Phi}$  such that  $\forall w \in \Sigma^*$ .  $w \in \mathcal{L}(A) \iff \llbracket \Phi \rrbracket_{\iota_w}^{\mathfrak{m}_w} = \text{true}$ 

Let  $\Phi(X_1, X_2, x_3, x_4)$  be:

- 1.  $X_1(x_3)$
- 2.  $x_3 \leq x_4$
- 3.  $X_1 = X_2$

#### From Formulae to Automata

 $A_{\Phi}$  is built by induction on the structure of  $\Phi$ :

- for  $\Phi = \phi_1 \wedge \phi_2$  we have  $\mathcal{L}(A_{\Phi}) = \mathcal{L}(A_{\phi_1}) \cap \mathcal{L}(A_{\phi_2})$
- for  $\Phi = \phi_1 \vee \phi_2$  we have  $\mathcal{L}(A_{\Phi}) = \mathcal{L}(A_{\phi_1}) \cup \mathcal{L}(A_{\phi_2})$
- for  $\Phi = \neg \phi$  we have  $\mathcal{L}(A_{\Phi}) = \overline{\mathcal{L}(A_{\phi})}$
- for  $\Phi = \exists X_i . \phi$ , we have  $\mathcal{L}(A_{\Phi}) = pr_i(\mathcal{L}(A_{\phi}))$ .

### Consequences

**Theorem 8** A language  $L \subseteq \Sigma^*$  is definable in WS1S iff it is recognizable.

Corollary 1 The SAT problem for WS1S is decidable.

**Exercise 2** Prove that there is no WS1S formula  $\varphi(x, y, z)$  that defines the relation  $\{(m, n, p) \in \mathbb{N}^3 \mid m + n = p\}$ .

#### Regular Languages

Let  $\Sigma$  be an alphabet, and  $X, Y \subseteq \Sigma^*$ 

$$XY = \{xy \mid x \in X \text{ and } y \in Y\}$$
  
 $X^* = \{x_1 \dots x_n \mid n \ge 0, x_1, \dots, x_n \in X\}$ 

The class of regular languages  $\mathcal{R}(\Sigma)$  is the smallest class of languages  $L \subseteq \Sigma^*$  such that:

- $\emptyset, \{\epsilon\} \in \mathcal{R}(\Sigma)$
- $\{\alpha\} \in \mathcal{R}(\Sigma)$ , for all  $\alpha \in \Sigma$
- if  $X, Y \in \mathcal{R}(\Sigma)$  then  $X \cup Y, XY, X^* \in \mathcal{R}(\Sigma)$

#### Regular, rational and recognizable languages

**Theorem 9 (Kleene)** A set of finite words is recognizable if and only if it is regular.

Proof in every textbook.

Rational = regular, in older books e.g.

Samuel Eilenberg. Automata, Languages and Machines. Academic Press, 1974

#### Star Free Languages

The class of *star-free languages* is the smallest class  $SF(\Sigma)$  of languages  $L \in \Sigma^*$  such that:

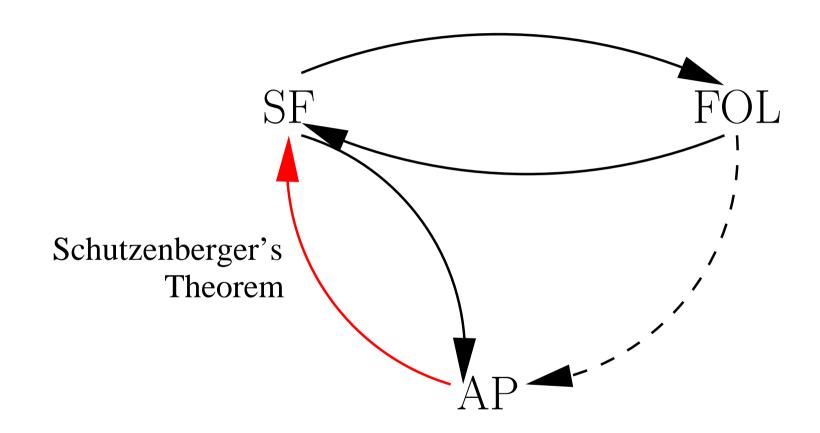

- $\emptyset, \{\epsilon\} \in SF(\Sigma) \text{ and } \{a\} \in SF(\Sigma) \text{ for all } a \in \Sigma$
- if  $X, Y \in SF(\Sigma)$  then  $X \cup Y, XY, \overline{X} \in SF(\Sigma)$

#### Example 2

- $\Sigma^* = \overline{\emptyset}$  is star-free
- if  $B \subset \Sigma$ , then  $\Sigma^*B\Sigma^* = \bigcup_{b \in B} \Sigma^*b\Sigma^*$  is star-free
- if  $B \subset \Sigma$ , then  $B^* = \overline{\Sigma^*} \overline{B} \overline{\Sigma^*}$  is star-free
- if  $\Sigma = \{a, b\}$ , then  $(ab)^* = \overline{b\Sigma^* \cup \Sigma^* a \cup \Sigma^* a a \Sigma^* \cup \Sigma^* b b \Sigma^*}$  is star-free

**Exercise 3** If  $\Sigma = \{a, b, c\}$ , write  $(ab)^*$  as a star-free language.

# SF = FOL (= AP)

## The Splitting Lemma

**Lemma 3** Let  $A, B \subseteq \Sigma$  be subalphabets such that  $A \cap B = \emptyset$ . Then, for each star-free language  $L \in SF(\Sigma)$ , we have:

$$L \cap B^*AB^* = \bigcup_{1 \le i \le n} K_i a_i L_i$$

where  $a_i \in A$  and  $K_i, L_i \in SF(B)$ , for all  $1 \leq i \leq n$ .

W.l.o.g. we prove the case  $A = \{a\}$  (why?) by induction on L:

- If  $L = \{a\}$  then  $L \cap B^*AB^* = \{\epsilon\}a\{\epsilon\}$ .
- If  $L = \{a'\}, a' \neq a$ , then  $L \cap B^*AB^* = \emptyset a\emptyset$ .
- If  $L = \Sigma^*$  then  $L \cap B^*AB^* = B^*AB^*$ .
- If  $L = L_1 \cup L_2$  then  $L \cap B^*AB^* = (L_1 \cap B^*AB^*) \cup (L_2 \cap B^*AB^*)$ .

#### The Splitting Lemma

$$L \cap B^*AB^* = \bigcup_{1 \le i \le n} K_i a_i L_i$$

- If  $L = L_1 \cdot L_2$  then  $L \cap B^*AB^* = (L_1 \cap B^*) \cdot (L_2 \cap B^*AB^*) \cup (L_1 \cap B^*AB^*) \cdot (L_2 \cap B^*).$
- Else, if  $L = \Sigma^* \setminus L'$ , by the inductive hypothesis  $L' = \bigcup_{1 \le i \le n} K'_i a L'_i$ . We assume w.l.o.g that  $\{K'_i\}_{i=1}^n$  form a patition of  $B^*$ :
  - if  $K'_i \cap K'_j \neq \emptyset$ , rewrite

$$K_i'aL_i' \cup K_j'aL_j' = (K_i' \setminus K_j')aL_i' \cup (K_j' \setminus K_i')aL_j' \cup (K_i' \cap K_j')a(L_i' \cup L_j')$$

- if 
$$\bigcup_{i=1}^n K_i' \subseteq B^*$$
, add  $(B^* \setminus \bigcup_{i=1}^n K_i')a\emptyset$  to  $\{K_i'aL_i'\}_{i=1}^n$ 

$$(\Sigma^* \setminus L') \cap B^* a B^* = \bigcup_{i=1}^n K_i' a (B^* \setminus L_i')$$

#### Subword Formulae

Let  $w = a_0 a_1 \dots a_{n-1}$  be a finite word, and  $w(i, j) = a_i a_{i+1} \dots a_{j-1}$  be a subword of  $w, 0 \le i < n$  and  $0 \le j \le n, i < j$ .

**Proposition 3** For each FOL sentence  $\varphi$  there exists a formula  $\varphi[x,y]$  such that, for each  $w \in \Sigma^*$  and each  $0 \le i < j \le |w|$ :

$$\mathfrak{m}_{w(i,j)} \models \varphi \iff \llbracket \varphi[x,y] \rrbracket_{[x\leftarrow i][y\leftarrow j]}^{\mathfrak{m}_w} = \mathbf{true}$$

By induction on the structure of  $\varphi$ :

$$(\neg \varphi)[x, y] = \neg(\varphi[x, y])$$

$$(\varphi \land \psi)[x, y] = (\varphi[x, y]) \land (\psi[x, y])$$

$$(\exists z. \varphi)[x, y] = \exists z . x \le z \land z < y \land \varphi[x, y]$$

#### Star Free Languages are FOL-definable

For each  $L \in SF(\Sigma)$ , there exists an FOL sentence  $\varphi_L$  such that:

$$L = \{ w \in \Sigma^* \mid \mathfrak{m}_w \models \varphi_L \}$$

By induction on the structure of L:

$$\emptyset = \{ w \in \Sigma^* \mid \mathfrak{m}_w \models \bot \}$$

$$\{ a \} = \{ w \in \Sigma^* \mid \mathfrak{m}_u \models p_a(0) \land last(0) \}$$

$$X \cup Y = \{ w \in \Sigma^* \mid \mathfrak{m}_u \models \varphi_X \lor \varphi_Y \}$$

$$\overline{X} = \{ w \in \Sigma^* \mid \mathfrak{m}_u \models \neg \varphi_X \}$$

$$X \cdot Y = \{ w \in \Sigma^* \mid \mathfrak{m}_u \models \exists y \exists z . 0 \le y \le z \land \varphi_X[0, y] \land \varphi_Y[y, z] \land last(z) \}$$

#### FOL-definable Languages are Star Free

Let  $\varphi$  be an FOL formula with  $FV(\varphi) = V$  and let  $\Sigma_V = \Sigma \times \{0,1\}^V$ .

Encode each pair  $(w, \iota)$ , with  $\iota : V \to [0, |w| - 1]$  as a word  $\overline{(w, \iota)} \in \Sigma_V^*$ :

$$\overline{(a_0 \dots a_{k-1}, \iota)} = (a_0, \tau_0) \dots (a_{k-1}, \tau_{k-1}), \ \tau_i(x) = 1 \iff \iota(x) = i$$

and let  $\mathcal{N}_V = \{ \overline{(w, \iota)} \mid w \in \Sigma^*, \iota : V \to [0, |w| - 1] \}.$ 

Let 
$$\Sigma_V^{x=i} = \{(a, \tau) \mid \tau(x) = i\}, \text{ for } i = 0, 1$$

$$\mathcal{N}_V = \bigcap_{x \in V} (\Sigma_V^{x=0})^* (\Sigma_V^{x=1}) (\Sigma_V^{x=0})^* \in SF(\Sigma_V)$$

#### FOL-definable Languages are Star Free

**Proposition 4** If  $\varphi \in FOL$  and  $FV(\varphi) \subseteq V$ , then  $[\![\varphi]\!]_V \in SF(\Sigma_V)$ .

$$[\![p_a(x)]\!]_V = \mathcal{N}_V \cap (\Sigma_V^* \cdot \{(a,\tau) \mid \tau(x) = 1\} \cdot \Sigma_V^*)$$
$$[\![x \le y]\!]_V = \mathcal{N}_V \cap (\Sigma_V^* \cdot \Sigma_V^{x=1} \cdot \Sigma_V^* \cdot \Sigma_V^{y=1} \cdot \Sigma_V^*)$$

#### FOL-definable Languages are Star Free

**Proposition 5** If  $\varphi \in FOL$  and  $FV(\varphi) \subseteq V$ , then  $[\![\varphi]\!]_V \in SF(\Sigma_V)$ .

If  $\varphi = \exists x . \phi$ , we assume w.l.o.g. that  $x \notin V$  ( $\alpha$ -conversion)

where  $K_i', L_i' \in SF(\Sigma_{V \cup \{x\}}^{x=0})$  and  $a_i' \in \Sigma_{V \cup \{x\}}^{x=1}$ , for all  $1 \leq i \leq n$ 

Let  $\pi: \Sigma_{V \cup \{x\}}^{x=0} \to \Sigma_V$  be the bijective (why?) renaming  $(a, \tau) \stackrel{\pi}{\mapsto} (a, \tau \downarrow_V)$ Let  $K_i = \pi(K_i'), L_i = \pi(L_i')$  and  $a_i = (a, \tau \downarrow_V) \iff a_i = (a, \tau)$ 

$$\llbracket \exists x . \phi \rrbracket_V = \bigcup_{i=1}^n K_i a_i L_i$$

**NB**: SF languages are preserved by bijective renamings (why bijective?)

# **Aperiodic Languages**

**Definition 3** A language  $L \subseteq \Sigma^*$  is said to be aperiodic iff:

$$\exists n_0 \forall n \geq n_0 \forall u, v, t \in \Sigma^* : uv^n t \in L \iff uv^{n+1} t \in L$$

 $n_0$  is called the index of L.

**Example 3**  $0^*1^*$  is aperiodic. Let  $n_0 = 2$ . We have three cases:

1.  $u, v \in 0^*$  and  $t \in 0^*1^*$ :

$$\forall n \geq 2 . uv^n t \in L$$

2.  $u \in 0^*, v \in 0^+1^+ \text{ and } t \in 1^*$ :

$$\forall n \geq 2 \ . \ uv^n t \not\in L$$

3.  $u \in 0^*1^*, v \in 1^* \text{ and } t \in 1^*$ :

$$\forall n \geq 2 \ . \ uv^n t \in L$$

## Periodic Languages

Conversely, a language  $L \subseteq \Sigma^*$  is said to be *periodic* iff:

$$\forall n_0 \exists n \ge n_0 \exists u, v, t \in \Sigma^* . (uv^n t \not\in L \land uv^{n+1} t \in L) \lor (uv^n t \in L \land uv^{n+1} t \not\in L)$$

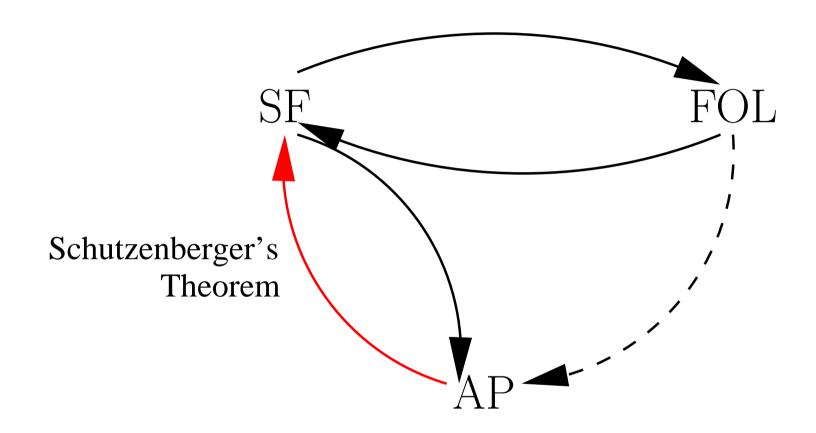

**Example 4** (00)\*1 is periodic.

Given  $n_0$  take the next even number  $n \ge n_0$ ,  $u = \epsilon$ , v = 0 and t = 1. Then  $uv^n t \in (00)^* 1$  and  $uv^{n+1} t \notin (00)^* 1$ .  $\square$ 

**Exercise 4** Is (00)\*1 WS1S-definable?

Exercise 5 Is the language (ab)\* periodic or aperiodic?

# The Big Picture

## From Star-free to Aperiodic

**Proposition 6** If  $L \in SF(\Sigma)$  then L is aperiodic.

Prove the existence of an integer N(L) such that

$$\forall n \geq N(L) \ \forall u \forall v \forall t \ . \ uv^n t \in L \iff uv^{n+1} t \in L$$

- . Suppose  $v \neq \epsilon$ . By induction on the structure of L:
  - $\emptyset : N(\emptyset) = 0$ , since  $\forall n \geq 0 : uv^n t \notin L$
  - $\{a\}, a \in \Sigma : N(\{a\}) = 2$ , since  $\forall n \ge 2$ .  $uv^n t \notin L$
  - $\overline{X}$ :  $N(\overline{X}) = N(X)$ , trivial
  - $X \cup Y : N(X \cup Y) = \max\{N(X), N(Y)\}, \text{ trivial}$
  - XY: N(XY) = N(X) + N(Y) + 1, since for all  $n = n_1 + n_2 + 1 \ge N(X) + N(Y) + 1$ , we have either  $n_1 \ge N(X)$  or  $n_2 \ge N(Y)$ . Then  $uv^n t = (uv^{n_1}r)(sv^{n_2}t)$ , where rs = v and  $uv^{n_1}r \in X$ ,  $sv^{n_2}t \in Y$ . If  $n_1 \ge N(X)$ ,  $uv^{n_1+1}r \in X \Rightarrow uv^{n+1}t \in XY$
